

In re Patent Application of:
MCCARTHY ET AL.
Serial No. 10/779,402
Filed: FEBRUARY 13, 2004
_____ /

In the Claims:

This listing of claims replaces all prior versions and listing of claims in the application.

1. (Currently Amended) A communications system comprising:

a plurality of servers connected together in a network for processing a plurality of different job types having respective different resource usage characteristics associated therewith;

each server determining a respective health metric thereof based upon at least one job being processed thereby and weighting the health metric based upon the respective resource usage characteristic of the at least one job;

said servers mapping the weighted health metrics for different resource usage characteristics to a common scale; and

a dispatcher for collecting the commonly scaled weighted health metrics from said servers and distributing jobs to said servers based thereon.

2. (Original) The communications system of Claim 1 wherein the resource usage characteristics comprise at least one processing utilization characteristic and at least one input/output utilization characteristic.

_____ /

3. (Original) The communications system of Claim 1 further comprising a knowledge base for cooperating with said dispatcher for storing the weighted health metrics.

4. (Cancelled)

5. (Original) The communications system of Claim 1 wherein said servers provide completed job results to said dispatcher, and wherein the weighted health metrics are provided to said dispatcher with the completed job results.

6. (Original) The communications system of Claim 5 further comprising at least one load generator for generating the jobs for said servers and communicating the jobs to said dispatcher; and wherein said dispatcher further provides the completed job results to said at least one load generator.

7. (Original) The communications system of Claim 1 wherein said dispatcher periodically polls said servers for the weighted health metrics.

8. (Original) The communications system of Claim 1 wherein the jobs relate to electronic mail (e-mail) processing.

9. (Currently Amended) A load distributor for a

plurality of servers connected together in a network for processing a plurality of different job types having respective different resource usage characteristics associated therewith, and each server determining a respective health metric thereof based upon at least one job being processed thereby and weighting the health metric based upon the respective resource usage characteristic of the at least one job, the load distributor comprising:

a dispatcher for collecting the weighted health metrics from the servers and distributing jobs to the servers based thereon;

said servers mapping the weighted health metrics for different resource usage characteristics to a common scale; and

a knowledge base for cooperating with said dispatcher for storing the commonly scaled weighted health metrics.

10. (Original) The load distributor of Claim 9 wherein the resource usage characteristics comprise at least one processing utilization characteristic and at least one input/output utilization characteristic.

11. (Cancelled)

12. (Original) The load distributor of Claim 9 wherein the servers provide completed job results to said dispatcher

_____ /

module, and wherein the weighted health metrics are provided to said dispatcher with the completed job results.

13. (Original) The load distributor of Claim 9 wherein said dispatcher periodically polls the servers for the weighted health metrics.

14. (Currently Amended) A job distribution method for a plurality of servers connected together in a network, the servers for processing a plurality of different job types having respective different resource usage characteristics associated therewith, the method comprising:

determining a respective health metric of each server based upon at least one job being processed thereby and weighting the health metric based upon the respective resource usage characteristic of the at least one job;

mapping the weighted health metrics for different resource usage characteristics to a common scale; and

distributing jobs to the servers based upon the commonly scaled weighted health metrics.

15. (Original) The method of Claim 14 wherein the resource usage characteristics comprise at least one processing utilization characteristic and at least one input/output utilization characteristic.

16. (Cancelled)

17. (Currently Amended) A computer-readable medium having computer-executable instructions for distributing jobs to a plurality of servers connected together in a network for processing a plurality of different job types having respective different resource usage characteristics associated therewith, and each server determining a respective health metric thereof based upon at least one job being processed thereby and weighting the health metric based upon the respective resource usage characteristic of the at least one job, the load distributor comprising:

a dispatcher module for collecting the weighted health metrics from the servers and distributing jobs to the servers based thereon;

the servers mapping the weighted health metrics for different resource usage characteristics to a common scale; and

a knowledge base module for cooperating with said dispatcher module to store the weighted health metrics.

18. (Original) The computer-readable medium of Claim 17 wherein the resource usage characteristics comprise at least one processing utilization characteristic and at least one input/output utilization characteristic.

Filed: **FEBRUARY 13, 2004**

19. (Cancelled)

20. (Original) The computer-readable medium of Claim 17 wherein the servers provide completed job results to said dispatcher module, and wherein the weighted health metrics are provided to said dispatcher module with the completed job results.

21. (Original) The computer-readable medium of Claim 17 wherein said dispatcher module periodically polls the servers for the weighted health metrics.
